Crop Update

June 11, 2025

Tropical activity is on the rise in the Eastern Pacific with 3 named storms so far this year and 2 potential systems currently brewing off the coast of Southwestern Mexico. Tropical storm Alvin brought substantial precipitation to the growing regions of Sonora Mexico last week impacting grape harvests in the region. Alvin was followed by Barbra and Cosme, both storm systems remained offshore with no impact to Southwestern Mexico. The next system currently off the coast of Southern Mexico is given an 90% chance of formation in the next week by NOAA as a second low pressure disturbance is expected to gradually develop next week.

In the Atlantic basin tropical activity is not expected this week but warmer than average ocean temperatures in the Gulf as well as in the Caribbean in general are conducive to storm formation. The high heat content in the ocean provides more energy to fuel storm development. NOAA's outlook for the Atlantic hurricane season, which runs from June to November predicts an above normal season this year with between 13 and 19 named system forecast.
